

UNIVERSITY OF RUHUNA
FACULTY OF TECHNOLOGY

SOFT SKILLS-TCS2122

Assignment-01

**Design a personal strength Enhancement plane for
next 5 months.**

A.KRISHNIKAN.

TG/2023/1777

ICT Department

Submit to:

Department of
Multi Disciplinary studies

Personal Strength Enhancement Plan (5 Months)

1. Advanced Java Technical Proficiency

- * **Why it is important:** As a BICT student, Java is a foundation for backend development, Android, and enterprise applications. Mastering it is crucial for employability.
- * **Specific Actions:** Complete a certification course (e.g., Oracle Certified Professional) and build a functional project like a Library Management System using JDBC.
- * **Resources:** Udemy/Coursera, JDK 21, IntelliJ IDEA, Stack Overflow.
- * **Expected Outcomes:** Ability to write clean, efficient, and object-oriented code.
- * **Measurement:** Successful compilation of a complex project with zero bugs and GitHub contributions.

2. Logical Thinking & Problem Solving

- * **Why it is important:** Programming is less about typing and more about solving logic puzzles. This helps in optimizing Java algorithms.
- * **Specific Actions:** Solve 2 LeetCode or HackerRank problems daily using Java (focusing on Data Structures).
- * **Resources:** LeetCode, "Cracking the Coding Interview" book.
- * **Expected Outcomes:** Reduced time taken to conceptualize solutions for complex coding tasks.
- * **Measurement:** Achieving a higher "rank" or "badge" on coding platforms.

3. Technical Documentation & Written Communication

- * **Why it is important:** Developers must explain how their code works. Poor documentation leads to project failure in team environments.

- * **Specific Actions:** Write a README.md for every Java project and maintain a technical blog or LinkedIn posts about what you've learned.
- * **Resources:** Markdown editors, GitHub, technical writing guides.
- * **Expected Outcomes:** Clear, concise documentation that a non-technical person can understand.
- * **Measurement:** Positive feedback from peers or lecturers on project reports.

4. Time Management (Agile Methodology)

- * **Why it is important:** Software projects often have tight deadlines. Managing our time is vital for the great job.
- * **Specific Actions:** Use a Kanban board (Trello) to break Java projects into 1-week time
- * **Resources:** Trello, Notion, or Jira.
- * **Expected Outcomes:** Completion of assignments 2 days before the deadline.
- * **Measurement:** Percentage of tasks completed within the scheduled "Sprint" time.

5. Collaborative Teamwork (Version Control)

- * **Why it is important:** Industry-level Java development happens in teams. You need to know how to merge your code with others without breaking it.
- * **Specific Actions:** Practice using Git (Branching, Merging, Pull Requests) even for individual projects to simulate a team environment.
- * **Resources:** Git, GitHub/GitLab.
- * **Expected Outcomes:** Mastery of the collaborative workflow used in modern tech companies.
- * **Measurement:** Number of successful merges and branches managed in your repository.
